# Pengertian meta-analisis

---

Meta-analisis adalah **metodologi statistik** untuk **mensintesis** hasil penelitian di berbagai **studi independent** (Koricheva *et al.* 2013).

# Langkah meta-analisis

---

Poin penting dalam meta-analisis:

1. Menentukan **topik**
2. Mengumpulkan dan **menyeleksi** naskah/jurnal yang dirujuk
3. Data dari naskah/jurnal terpilih **ditabulasi** dan **dianalisis**
4. Hasil analisis dirangkum dan **diinterpretasi**

# 1. Membuat topik meta-analisis (Yanza 2020)

---

- i **Independen (Y):** Dosis aditif (mg/Kg as fed) dan level pemberian pakan (% as fed)
- ii **Subyek:** Ruminansia (kambing dan domba) dan monogastrik (ayam pedaging/broiler dan babi)
- iii **Dependen (X):** Parameter performa (bobot badan (bb, g), pertambahan bobot badan harian (pbbh, g/hari), konsumsi pakan harian (kph, g/hari), dan konversi pakan (fcr))

## 2. Pencarian dan seleksi sumber KTI

## 2. Contoh: Seleksi KTI (Choi 2013)

### Abstract

1. The present study investigated the effects of dietary supplementation with an antimicrobial peptide-A3 (AMP-A3) on growth performance, nutrient retention, intestinal microflora and intestinal morphology of broilers.

2. A total of 320-d-old chicks (Ross 308, average BW  $44.0 \pm 3.4$  g) were randomly allotted to 4 dietary treatments on the basis of initial body weight (BW). The dietary treatments were negative control (NC; basal diet), positive control (PC; basal diet + 15 mg avilamycin/kg diet) and AMP-A3 (basal diet supplemented with 60 or 90 mg/kg AMP-A3). The NC diet was considered as 0 mg/kg AMP-A3 treatment. Experimental diets were given to birds in starter phase (d 0–21) and finisher phase (d 22–35).

3. The overall BW gain and retention of dry matter (DM), gross energy (GE; d 19–21) and crude protein (CP; d 19–21 and d 33–35) were greater in birds fed on the PC and 90 mg/kg AMP-A3 diets than in birds fed on the NC diet. Also, an increase in dietary AMP-A3 linearly improved BW gain and retention of DM, GE (d 19–21) and CP (d 19–21 and d 33–35).

4. Birds fed on the PC and 90 mg/kg AMP-A3 diets had fewer excreta coliforms (d 21 and d 35), total anaerobic bacteria (TAB) and *Clostridium* spp. (d 35) and ileum and caecum coliforms (d 35) than birds fed on the NC diet. In addition, birds fed on the diet supplemented with increasing levels of AMP-A3 had linearly reduced excreta TAB (d 35), *Clostridium* spp. and coliforms (d 21 and d 35) and ileum and caecum coliforms (d 35).

5. Birds fed on the PC and 90 mg/kg AMP-A3 diets had greater villus height of the duodenum, jejunum and ileum than birds fed on the NC diet. Moreover, birds fed on increasing levels of AMP-A3 diet had increased (linear) villus height of the duodenum, jejunum and ileum.

6. These results indicate that 90 mg/kg AMP-A3 has the potential to improve growth performance, nutrient retention and intestinal morphology and to reduce harmful microorganisms in broilers and can be used as a potential antimicrobial growth promoter.

**ABSTRACT.** The present meta-analysis evaluated the effect of the level of antimicrobial peptides (AMPs) on broiler chicken growth performance, digestibility, small intestine morphology and blood serum parameters. The database was developed from 29 articles comprising 36 experiments. Data were analyzed using a mixed model methodology considering the levels of AMPs as fixed effects and different studies as random effects. It was shown that an increased AMPs addition level quadratically influenced body weight (BW), average daily gain (ADG) and feed conversion ratio (FCR) ( $P < 0.05$ ). Simultaneously, it linearly reduced mortality ( $P < 0.05$ ) both in the starter and finisher periods. There was a linear increase in metabolizable energy ( $P < 0.05$ ). Small intestine morphology in the duodenum, as indicated by villus height and villus height to crypt depth ratio linearly increased, while the crypt depth was linearly decreased ( $P < 0.05$ ). The mucosa thickness was quadratically affected in the jejunum, while the crypt depth linearly decreased ( $P < 0.05$ ). Categorical analysis showed that AMPs had a comparable effect with antibiotics on broiler performance (BW, ADG, FCR) ( $P > 0.05$ ); however the improvement in comparison with the non-supplemented group was stated ( $P < 0.01$ ). In conclusion, it is evidenced that AMPs can be used as an effective replacer of antibiotic growth promoters (AGP) because they can improve growth performance, digestibility, small intestine morphology and blood serum parameters of broiler in all rearing periods. Also, the optimal doses of dietary AMPs addition at 337 and 359 mg/kg of diet for the starter and finisher phases, respectively are suggested.
